

OKLAHOMA

SUMMARY

- Oklahoma is in the red zone for cases, indicating 101 or more new cases per 100,000 population, with the 16th highest rate in the country. Oklahoma is in the red zone for test positivity, indicating a rate at or above 10.1%, with the 3rd highest rate in the country.
- Oklahoma has seen stability in new cases and an increase in test positivity.
- The following three counties had the highest number of new cases over the last 3 weeks: 1. Oklahoma County, 2. Tulsa County, and 3. Cleveland County. These counties represent 42.3% of new cases in Oklahoma.
- 97% of all counties in Oklahoma have moderate or high levels of community transmission (yellow, orange, or red zones), with 97% having high levels of community transmission (red zone).
- During the week of Nov 23 - Nov 29, 30% of nursing homes had at least one new resident COVID-19 case, 45% had at least one new staff COVID-19 case, and 14% had at least one new resident COVID-19 death.
- Oklahoma had 539 new cases per 100,000 population, compared to a national average of 385 per 100,000.
- Current staff deployed from the federal government as assets to support the state response are: 2 to support operations activities from FEMA.
- The federal government has supported surge testing in several cities across the state.
- Between Nov 28 - Dec 4, on average, 320 patients with confirmed COVID-19 and 103 patients with suspected COVID-19 were reported as newly admitted each day to hospitals in Oklahoma. This is a minimal change in total COVID-19 hospital admissions.

RECOMMENDATIONS

- We have added a visual of your new hospital admissions for your state over the last 4 months so every state can see in pictures the significant increase in new hospitalizations for COVID-19.
- Also, please review the national maps at the back of your profile, which include pictorial timelines of the United States pandemic.
- This current fall to winter surge continues to spread to every corner of the US, from small towns to large cities, from farms to beach communities. This surge is the most rapid increase in cases; the widest spread of intense transmission, with more than 2,000 counties in COVID red zones; and the longest duration of rapid increase, now entering its 8th week, that we have experienced.
- Despite the severity of this surge and the threat to the hospital systems, many state and local governments are not implementing the same mitigation policies that stemmed the tide of the summer surge; that must happen now.
- We are also seeing clear improvement in many European countries that implemented strong public and private mitigation but preserved schooling; the majority of the United States is not mitigating similarly.
- Mitigation efforts must increase, including the implementation of key state and local policies with an additional focus on uniform behavioral change including masking, physical distancing, hand hygiene, no indoor gatherings outside of immediate households, and aggressive testing to find the asymptomatic individuals responsible for the majority of infectious spread.
- In the past week, significant reductions in testing and increases in percent positivity were observed. Primarily those with symptoms are being diagnosed; aggressive testing to find asymptomatic individuals responsible for the majority of infectious spread must be scaled. Testing data on age and ethnicity should be tracked to allow for more precise planning. The current vaccine implementation will not substantially reduce viral spread, hospitalizations, or fatalities until the 100 million Americans with comorbidities can be fully immunized, which will take until the late spring. Behavioral change and aggressive mitigation policies are the only widespread prevention tools that we have to address this winter surge.
- Unlike other states in the Heartland, cases and new hospital admissions are not plateauing. Virus levels continue to increase and are extremely high; activities that were safe in the summer are not safe now. Reexamine capacity thresholds for all public spaces. Effective practices to decrease transmission in public spaces include limiting restaurant indoor capacity to <25%, closing bars/limiting bar hours until cases and test positivity decrease to the yellow zone, and requiring masks in all public spaces.
- Must increase testing levels to find asymptomatic individuals to remove source of spread.
- Universities must have weekly testing plans in place for spring semester, mandatorily testing all students weekly to prevent spread in the community. Universities who tested all students weekly starting the first week of fall semester saw between 75% and 90% fewer cases than those who did not. For the remaining time in current semester, students must be tested weekly prior to returning home for winter break.
- Ensure all hospitals and clinical sites have updated training on use and timing of effective interventions, contingency staffing plans with appropriate task-shifting, and maximized access to medications and supplies.
- Conduct active testing in schools for teachers and students where cases are increasing. In accordance with CDC guidelines, masks must be worn by students and teachers in K-12 schools. Consider pausing extracurricular school activities, even though athletics are not transmission risks, as the surrounding activities are where transmission is occurring.
- Ensure full flu immunizations across the state.
- In Tribal Nations, conduct weekly testing of Tribal communities living on and off the reservation. Test results should be rapid, and isolation and contact tracing conducted immediately. Ensure sufficient facilities for isolation/quarantine with support services.
- Specific, detailed guidance on community mitigation measures can be found on the [CDC website](#).

The purpose of this report is to develop a shared understanding of the current status of the pandemic at the national, regional, state and local levels. We recognize that data at the state level may differ from that available at the federal level. Our objective is to use consistent data sources and methods that allow for comparisons to be made across localities. We appreciate your continued support in identifying data discrepancies and improving data completeness and sharing across systems. We look forward to your feedback.

OKLAHOMA

STATE REPORT | 12.06.2020

	STATE	STATE, % CHANGE FROM PREVIOUS WEEK	FEMA/HHS REGION	UNITED STATES
NEW COVID-19 CASES (RATE PER 100,000)	21,310 (539)	+5%	156,138 (366)	1,264,488 (385)
VIRAL (RT-PCR) LAB TEST POSITIVITY RATE	21.7%	+2.8%*	13.5%	11.5%

SNFs WITH ≥1 NEW RESIDENT COVID-19 DEATH	14%	N/A*†	10%	11%
TOTAL NEW COVID-19 HOSPITAL ADMISSIONS (RATE PER 100 BEDS)	2,960 (31)	+4% (+4%)	19,037 (21)	148,450 (20)

* Indicates absolute change in percentage points.

** Due to delayed reporting, this figure may underestimate total diagnostic tests and week-on-week changes in diagnostic tests.

† Skilled nursing facility data entry is experiencing a lag due to the Thanksgiving holiday and changes to the questionnaire. Therefore, the most current week's data should not be compared to previous data.

DATA SOURCES – Additional data details available under METHODS

Note: Some dates may have incomplete data due to delays in reporting. Data may be backfilled over time, resulting in week-to-week changes.

Cases and Deaths: State values are calculated by aggregating county-level data from USAFacts; therefore, the values may not match those reported directly by the state. Data is through 12/4/2020; previous week is 11/21 - 11/27.

Testing: CELR (COVID-19 Electronic Lab Reporting) state health department-reported data through 12/2/2020. Previous week is 11/19 - 11/25.

SNFs: Skilled nursing facilities. National Healthcare Safety Network. Data are reported separately for cases among residents and staff. Data is through 11/29/2020, previous week is 11/16-11/22. Facilities that are undergoing reporting quality review are not included in the table, but may be included in other NHSN analyses.

Admissions: Unified hospitalization dataset in HHS Protect. These data exclude psychiatric, rehabilitation, and religious non-medical hospitals. Hospitals explicitly identified by states/regions as those from which we should not expect reports were excluded from the totals. Totals include confirmed and suspected COVID-19 admissions.

Europe is experiencing a fall surge similar to the USA and is showing early signs of improvement through country-specific mitigation efforts.

- 80% (48/60 countries) require wearing masks in all public settings
 - Most countries have imposed fines for non-compliance
- 93% (56/60) have significant restrictions on gathering size
- 63% (38/60) have some form of nonessential business closures, initially focused on bars and reducing restaurant capacity
- 60% (37/60) have some form of entertainment or public space restriction
- 65% (39/60) have deployed a contact tracing app

DATA SOURCES

- Some dates may have incomplete data due to delays and/or differences in state reporting. Data may be backfilled over time, resulting in week-to-week changes. It is critical that states provide as up-to-date data as possible. Figures and values may also differ from state reports due to differing methodologies.
- Color threshold values are rounded before color classification.
- Cases and deaths:** County-level data from USAFacts as of 20:30 EST on 12/06/2020. State values are calculated by aggregating county-level data from USAFacts. Data are reviewed on a daily basis against internal and verified external sources and, if needed, adjusted.
- Testing:** The data presented represent viral COVID-19 laboratory diagnostic and screening test (reverse transcription polymerase chain reaction, RT-PCR) results—not individual people—and exclude antibody and antigen tests, unless stated otherwise. CELR (COVID-19 Electronic Lab Reporting) state health department-reported data are used to describe county-level viral COVID-19 RT-PCR result totals when information is available on patients' county of residence or healthcare providers' practice location. HHS Protect laboratory data (provided directly to Federal Government from public health labs, hospital labs, and commercial labs) are used otherwise. Because the data are deidentified, total RT-PCR tests are the number of tests performed, not the number of individuals tested. RT-PCR test positivity rate is the number of positive tests divided by the number of tests performed and resulted. Last week data are from 11/26 to 12/2; previous week data are from 11/19 to 11/25; the week one month before data are from 10/29 to 11/4. HHS Protect data is recent as of 12:29 EST on 12/06/2020. Testing data are inclusive of everything received and processed by the CELR system as of 19:00 EST on 12/05/2020.
- Hospitalizations:** Unified hospitalization dataset in HHS Protect. These data exclude psychiatric, rehabilitation, and religious non-medical hospitals. In addition, hospitals explicitly identified by states/regions as those from which we should not expect reports were excluded from the percent reporting figure. The data presented represents raw data provided; we are working diligently with state liaisons to improve reporting consistency. Data is recent as of 17:19 EST on 12/06/2020.
- Hospital PPE:** Unified hospitalization dataset in HHS Protect. This figure may differ from state data due to differences in hospital lists and reporting between federal and state systems. These data exclude psychiatric, rehabilitation, and religious non-medical hospitals. Hospitals explicitly identified by states/regions as those from which we should not expect reports were excluded from the percent reporting figure. Data is recent as of 16:52 EST on 12/5/2020.
- Skilled Nursing Facilities:** National Healthcare Safety Network (NHSN). Data report resident and staff cases independently. Quality checks are performed on data submitted to the NHSN. Data that fail these quality checks or appear inconsistent with surveillance protocols may be excluded from analyses. Data presented in this report are more recent than data publicly posted by CMS. Last week is 11/23-11/29, previous week is 11/16-11/22. Facilities that are undergoing reporting quality review are not included in the table, but may be included in other NHSN analyses.
- County and Metro Area Color Categorizations**
 - Red Zone:** Those core-based statistical areas (CBSAs) and counties that during the last week reported both new cases at or above 101 per 100,000 population, and a lab test positivity result at or above 10.1%.
 - Orange Zone:** Those CBSAs and counties that during the last week reported both new cases between 51–100 per 100,000 population, and a lab test positivity result between 8.0–10.0%, or one of those two conditions and one condition qualifying as being in the “Red Zone.”
 - Yellow Zone:** Those CBSAs and counties that during the last week reported both new cases between 10–50 per 100,000 population, and a lab test positivity result between 5.0–7.9%, or one of those two conditions and one condition qualifying as being in the “Orange Zone” or “Red Zone.”
