

DISEASE INTERVENTION SERVICES

For the Provider

What are Disease Intervention Services?

Disease Intervention Services are a critical part of a comprehensive array of services offered to persons newly identified with HIV and/or syphilis. By identifying persons with HIV and/or syphilis, and confidentially notifying their partners of their possible exposure, and providing persons who are positive and their partners a range of medical, prevention, and psychosocial services. Disease Intervention Services can improve the health not only of individuals, but of communities as well.

Goals

1. Provide services to persons with HIV and/or syphilis, including providing them risk-reduction counseling, linking them to medical care, and making referrals to other services.
2. Ensure that sex and drug-injection partners of persons with HIV and/or syphilis are notified of their exposure, providing counseling and testing, treated or linked to medical care if needed, and provided other appropriate referrals.
3. Reduce future rates of transmission by aiding in early diagnosis.

How is Disease Intervention Services initiated?

All positive HIV, Syphilis, Gonorrhea and Chlamydia results are required to be reported to the Oklahoma State Department of Health (OSDH). Upon report, a member of the surveillance staff determines if the client is eligible for Disease Intervention Services. If the client is eligible for these services, the information will be sent to the Disease Intervention Specialist (DIS) to initiate.

Who is eligible for Disease Intervention Services?

Most people who are newly diagnosed with HIV and/or syphilis are eligible for Disease Intervention Services.

Who are the DIS?

DIS are highly trained, **non-clinical**, public health professionals with applied knowledge of HIV and Syphilis. The DIS interview all persons newly identified with HIV and/or syphilis to provide services including, but not limited to, Partner Services and Linkage to Care.

What services are provided by the DIS?

Linkage to Care: If a HIV positive client has not made a medical appointment for HIV care, the DIS can assist the client in making their first appointment.

Treatment: DIS can arrange for treatment needed for sexually transmitted diseases (STDs).

Confidential Partner Notification: DIS will discuss the need of notifying sexual and needle-sharing partners of the possible exposure with the positive client. The DIS will work with the client to create a plan to inform any sexual and/or needle-sharing partners about an exposure to HIV and/or syphilis.

What happens when a DIS notifies a partner?

The DIS will confidentially notify a partner of the possible exposure to HIV and/or syphilis. This is done without providing any information about the positive person. The DIS will also provide testing and arrange treatment when needed.

Best Practice: When the Health Department Informs Partners

When health departments take responsibility for notification, more partners are successfully notified of their exposure. For clients, this method helps maintain their anonymity and relieves them of the burden of disclosure. Additionally, it links clients to other resources, such as psycho-social services. For the exposed partner, this method facilitates quick access to testing and linkage to care for treatment and other services.

What are the advantages of Disease Intervention Services for the positive person?

Informing Partners: DIS can notify sexual and/or needle-sharing partners of possible exposure, eliminating the burden on the positive person, allowing them to focus on their health.

Confidential: A positive person may not feel comfortable disclosing their status to sexual or needle-sharing partners. Partner Services provides partner notification without disclosing any information about the positive partner.

Professional: DIS can provide additional information regarding the disease for which the client has tested positive, arrange treatment, and provide other needed referrals. They will also discuss risk reduction techniques to reduce the risk of getting the disease again or sharing it with others.

Safety: Partner Services provides a safe way to reach partners and minimize risk of physical or emotional harm to the positive person.

Empowerment: The positive client is taking an active role in their own care and in the care of those important to them.

Disease Intervention Services are Confidential

DIS are extensively trained to maintain a client's confidentiality. Throughout the Disease Intervention process, names or identifiers (including the dates of exposure) are never revealed to the partners. The anonymity and privacy of the patient is the highest priority.

What are the advantages of Disease Intervention Services for the partner?

- Partners are notified quickly of possible exposure, which they may not otherwise be aware.
- DIS offer free and confidential HIV and syphilis testing at a location that is convenient for the partner.
- DIS arrange any needed treatment or medical care.
- Partner Notification provides personalized education to those at highest risk of getting HIV and/or syphilis.

What is the provider's role in Disease Intervention Services?

The connection between health care providers and clients is critical in helping to identify sexual and needle-sharing partners. Health care providers have this opportunity to prevent the further spread of STDs and HIV by informing the client the health department will be contacting them soon. This is an ideal time to inform the client of the value and importance of Partner Services. It only takes a few minutes, but presenting Partner Services in a positive light will help your clients' partners and could prevent new cases and save lives.

You Can Help!

Educate your clients about Disease Intervention Services and its importance in preventing the spread of HIV and syphilis.

When to call the DIS?

- Anytime you have a question about Disease Intervention Services.
- When you need assistance providing positive results to a client.
- When you need to arrange treatment for a client.
- If you need treatment recommendations.
- When you want to directly inform the DIS of a new positive (you still must report it to OSDH surveillance).

Who to Call

Disease Intervention Services is divided into four teams: Oklahoma County, Tulsa County, and Outlying EAST & WEST Counties.

Oklahoma County Supervisor Erinn Williams 405-312-0925	Tulsa County Supervisor William Patterson 918-290-9949	DIS Field Operations Manager Portia King 405-306-9367	Outlying Counties EAST Supervisor John Fleming 918-237-3910	Outlying Counties WEST Supervisor Jordan Canary 405-426-7430
