

# Marginal Wells: *fuel for economic growth*

## 2006 Report

## About the Interstate Oil and Gas Compact Commission

The Interstate Oil and Gas Compact Commission is a multi-state government agency that promotes the conservation and efficient recovery of our nation's oil and natural gas resources while protecting health, safety and the environment.

The IOGCC consists of the governors of 37 states (30 members and seven associate states) that produce most of the oil and natural gas in the United States, as well as seven international affiliates. Chartered by Congress in 1935, the organization is the oldest and largest interstate compact in the nation.

The IOGCC assists states in balancing interests through sound regulatory practices. These interests include: maximizing domestic oil and natural gas production, minimizing the waste of irreplaceable natural resources, and protecting human and environmental health.

The IOGCC also provides an effective forum for government, industry, environmentalists and others to share information and viewpoints, allowing members to take a proactive approach to emerging technologies and environmental issues. For more information visit [www.iogcc.state.ok.us](http://www.iogcc.state.ok.us) or call 405-525-3556.

## About the Oklahoma Commission on Marginally Producing Oil and Gas Wells

*Special thanks to the Oklahoma Commission on Marginally Producing Oil and Gas Wells.*

The Oklahoma Commission on Marginally Producing Oil and Gas Wells is an Oklahoma state agency, funded by the oil and natural gas industry, with a purpose of protecting and promoting Oklahoma production of crude oil and natural gas. The organization's purpose is to serve the operator with its technology transfer programs; to serve the state by making sure that its most vital resource is continuously produced and not prematurely abandoned; and to serve the public as an information source regarding the importance of the industry in their lives and the state in which they live. For more information, visit [www.marginalwells.com](http://www.marginalwells.com).

# Introduction

---

The information within these pages tells an exciting story about one of America's greatest treasures. Marginal, low volume wells are the model of conservation and economic development, contributing significantly to the lifestyles of all Americans.

The Interstate Oil and Gas Compact Commission has been telling the story of these wells since the beginning of World War II – a time when conservation could not have been more important. Today, they continue to be critical suppliers of the nation's energy.

Although marginal wells are not glamorous and may receive little attention, together they provide 17 percent of oil and 9 percent of natural gas produced onshore in this country. In fact, without these wells the United States would have to increase imports by nearly 7 percent to make up for the shortage.

The increase in this year's production numbers illustrates the increasing importance of these wells. Daily marginal gas production averaged its highest in 10 years. On the oil side, smaller producing states such as New York are also experiencing dramatic increases in production.

However, the wells' influence stretches far beyond the oil and gas industry. Every dollar of marginal oil and gas production creates nearly \$1.01 of economic activity. Additionally, nearly 10 jobs are dependent upon every \$1 million of marginal oil and gas produced.

Marginal wells provide American energy to Americans and stand as a testament to ingenuity and conservation. The cumulative energy provided by these tiny producers touches the lives of all Americans, providing tax revenue for states, jobs for American families and energy security.

It is our hope that the numbers from this report tell this story and explain the role marginal wells continue to play in providing for the country's bright energy future.

*Marginal wells are the model of conservation and economic development, contributing significantly to the lifestyles of all Americans.*

# research and development

Research is key to the survival of marginal wells. Unfortunately, the small, independent producers who operate these wells oftentimes do not have the means to conduct their own research.

Federal and state governments and universities play a crucial role in research and development (R&D) for fossil energy. Without continued funding of these R&D programs, new methods for producing domestic energy will remain beyond the reach of American energy producers.

Unfortunately, just when R&D is most needed, federal funding is being reduced. This year the U.S. House and Senate Appropriations Committees eliminated the appropriation for federally funded oil and natural gas R&D through the U.S. Department of Energy's Office of Fossil Energy. Such a decision will deal a serious blow to the ability of our country, particularly the small producer, to keep pace technologically.

In addition, the strategies of major multinational oil companies direct much of their R&D dollars to resources that reward shareholders. Independent producers cannot justify large R&D expenditures, and 85 percent of wells in the United States, including most marginal wells, are drilled by those independent oil and gas companies.

Moreover, the shrinking major and multinational companies have taken a toll on consortia funding for domestic university research programs, thus reducing the number of active companies able to fund academic programs by half. The result is a continuing struggle for new funding mechanisms, which has been compounded by shrinking federal petroleum R&D funding in academia.

These factors and trends predict increasing difficulty for advancing R&D in the United States. For energy R&D, especially oil and natural gas upstream R&D directed at the nation's domestic resources, the battle will be even more difficult.

Marginal oil and natural gas wells are an often overlooked, but vitally important, segment of the domestic petroleum industry. In the years ahead, R&D funding will be critical to ensuring the producers of these wells have the tools necessary to continue supplying much-needed domestic energy to the nation.

More information about the current state of R&D can be found in the 2006 IOGCC publication "Who Will Fund America's Energy Future." To order a copy of the report, log on to [www.iogcc.state.ok.us](http://www.iogcc.state.ok.us).

*R&D funding is critical to ensuring the producers of marginal wells have the tools necessary to continue supplying much-needed domestic energy to the nation.*

# What is Marginal Oil?

Marginal oil is produced from wells that operate on the lower edge of profitability. Generally speaking, low-volume “stripper” wells – defined by the IOGCC as those wells producing 10 barrels of oil per day or less – fall into this category. The IOGCC has monitored the status of marginal wells in the United States since the 1940s.

Why all the concern about such small-volume wells? While each individual well contributes only a small amount of oil (2.2 barrels a day, on average), there are 401,072 of these wells in the United States. Combined, these marginal wells produced more than 321 million barrels of oil in 2005.

## Plugged/Abandoned Wells

Many states have programs that allow a well to temporarily stop production. These “idle” wells are not included in the abandoned well category of this report; only wells that have been permanently plugged are included in the IOGCC’s definition. Also not included in this study’s abandoned well figures are “orphaned” wells. These are wells that are not producing,

have not been plugged, and whose owners are either insolvent or cannot be located.

For more information about idled and orphaned wells, contact the IOGCC.

*A marginal oil well produces 10 barrels or less of oil per day.*

## U.S. Marginal Oil Well Data – Past 10 Years

Year	Number of Marginal Oil Wells	Marginal Oil Production (M bbls)	Average Daily Production Per Well (bbls)	Oil Wells Plugged/Abandoned
1996	428,842	323,468,274	2.06	16,674

<b>2005</b>	<b>401,072</b>	<b>321,761,570</b>	<b>2.20</b>	<b>11,058</b>

# secondary recovery

The term “secondary recovery” encompasses a variety of techniques designed to increase oil recovery from an existing well. Pressure in an underground formation pushes oil upward, allowing it to be extracted. In older wells and mature fields, this

pressure has diminished over time, decreasing the flow of oil. Secondary recovery techniques permit the injection of a substance, such as water or gas, into the formation. This increases the pressure and encourages the oil to flow more easily.

## Secondary Recovery of Marginal Oil as of January 1, 2006

Marginal Oil Production Comparison: 2004 v 2005

\* Estimated

# What is Marginal Gas?

Marginal gas is natural gas produced from a well that operates on the lower edge of profitability. Generally speaking, these are low-volume “stripper” gas wells – defined by the IOGCC as a natural gas well that produces 60 thousand cubic feet (Mcf) per day or less.

Marginal gas wells represent more than 9 percent of the total natural gas produced onshore in the lower 48 states.

The table on the following page indicates the status of marginal gas production over the past 10 years.

The number of gas wells in the marginal category has steadily increased during the past decade. Total production from marginal gas wells also has steadily increased, with daily production averaging its highest in 10 years.

As with marginal oil wells, “abandoned” natural gas wells are those that have been permanently plugged. Significantly, the

total number of pluggings in 2005 increased for the fifth consecutive year, while demand for natural gas continues to rise.

*A marginal gas well produces 60 Mcf or less of natural gas per day.*

## U.S. Marginal Gas Well Data – Past 10 Years

# ECONOMIC IMPACT

---

By Dan Olds, Ryder Scott Petroleum Consultant

The United States public is concerned about world oil markets in a manner reminiscent of the oil embargo of the 1970s. The cost of gasoline and natural gas for home heating are constant reminders of how our economy is dependent on hydrocarbon fuels to make our lifestyle possible. Further, there are concerns regarding our future energy security. More people are becoming aware of how the United States competes for oil supplies in a world market against countries such as China and India, where demand continues to rise.

The United States is dependent on imports from foreign countries, and some of those countries aren't friendly or are having oil problems of their own. Historically, the United States has received a large portion of its oil imports from Venezuela, but their president has made it clear that, for political reasons, he'd like to sell that oil to someone else. Mexico is another big source of our oil imports, but there are concerns that their largest offshore fields are declining at a rapid rate. Bolivia is not a factor for U.S. oil imports but their government has effectively nationalized the oil and gas industry. Russia continues to move in a direction that may effectively accomplish the same thing. Although not a significant producer, Chad is not satisfied with the contracts they made to attract oil companies to their country; now they want to re-negotiate the deal. Iran does not export oil to the United States but their actions are impacting the world oil market. Closer to home, production from Alaska's North Slope has been cut drastically while repairs are being made to aging infrastructure.

Last year's hurricane damage to facilities in the Gulf of Mexico is still being repaired.

This type of political uncertainty, the disruptions to infrastructure and continued strong demand have all combined to drive oil prices, and hence gasoline prices, to record levels. Economists may argue that the prices have not kept pace with inflation and that in real terms, prices were higher back in the 1970s. But regardless of whether the price of gasoline is considered in real dollars or nominal dollars, the fact remains that \$50 will not fill up the tank of most cars, and \$50 is still a lot of money to most people.

Oil is not the only issue. The United States has long been producing more natural gas than oil. While oil is primarily a transportation fuel, natural gas provides a lot of home heat and electricity. The high cost of natural gas has greatly increased winter heating bills in some parts of the country. In electric generation markets, natural gas is used for peak demand, since gas fired generators can be brought on line quickly to meet demands from air conditioning on hot days. Summertime electricity brownouts and high gasoline prices have reminded people not to take the conveniences of modern life for granted.

The United States imported 72 percent of its crude oil needs in 2005 – over 13 million barrels per day. Imports have been steadily rising for years and the recent high

prices haven't seemed to change this trend. There are no near-term solutions to this dependence on imported crude, so it is important that we preserve and encourage the domestic production that we have.

Domestic oil production is about 5.1 million barrels per day. Of that, production from low rate wells, termed marginal wells, is more than 881 thousand barrels per day, accounting for more than 17 percent of domestic oil production. Using 2005's average wellhead oil price of \$50.26 per barrel, that is \$16 billion that was not spent on imports.

The United States also imports natural gas, although not nearly at the volume of crude oil. However, like oil, natural gas imports are rising and forecasts for continued strong demand dictate that the level of imports will continue to rise.

Historically, imports of natural gas were limited to volumes transported by pipeline from Canada and Mexico with small amounts arriving in tankers as liquefied natural gas (LNG). However, there are plans for several new LNG receiving facilities in various places around the country, and it is expected that LNG will become an important part of our energy supply.

As with oil wells, there are also marginal gas wells. Natural gas production is not as mature as oil, but still marginal gas production provided about 4.8 billion cubic feet per day last year, more than 9 percent of U.S. production.

The purpose of this report is to examine the economic impact that marginal oil and gas has in the United States. Not only is this production an important part of the energy supply and energy security of the United States, but the economic impact is material. It is also significant that a significant portion of this economic activity benefits rural America. Royalties from the production go to farmers and landowners, and local labor is necessary to maintain these wells.

This report focuses on the marginal oil and gas activity in 11 survey states. The original survey states for this report were based on the top producers of oil, with Alaska excluded because although it is a top oil producing state, there is essentially no marginal production there. When marginal gas statistics became available some years ago, the same survey states were used for consistency. Economic results for these states have been extrapolated to represent the economic impact of marginal production in the entire United States.

*In 2005, marginal wells produced 17 percent of domestic oil and 9 percent of natural gas.*

# development of findings

Using data from the IOGCC's 2006 Marginal Well Report, Table 1 shows that the 11 survey states have more than 73 percent of the 401,072 total reported marginal oil wells in the United States. These wells produced more than 89 percent of marginal oil well production. Oil wells in the survey states averaged 2.7 barrels of oil per day (BOPD), better than the overall national average of 2.2 BOPD.

In 2005, 13,265 oil wells were plugged and abandoned, which is a substantial increase over last year's total of 11,977 oil wells plugged. With oil prices at such high levels, the increase in well abandonments is unexpected. One possible explanation is that well operators are using their cash flow to cover deferred abandonment obligations.

Looking at the marginal gas wells, Table 1 shows the 11 survey states have about 44 percent of the total 288,898 marginal gas wells in the United States. The total number of marginal gas wells in the United States again increased significantly from last year by 17,042 wells, whereas the number of marginal oil wells increased by only 3,710 wells.

Our original 11 survey states were based on the largest producers of marginal oil, which excluded the Appalachian states from consideration. The Appalachian Basin accounts for about 50 percent of the marginal gas well count and nearly 29 percent of the marginal gas produced. These percentages are down slightly from last year, as operators in other states are finding it economical to maintain production in wells with higher operating costs.

In order to preserve the comparability of this report, the marginal gas wells use the same survey states as the oil wells, as any error that may be introduced is not thought to be materially significant due to the higher relative value of marginal oil to marginal gas production.

Marginal gas wells produced 1,760 billion cubic feet (Bcf) in 2005, more than 4.8 Bcf per day. Each well averaged 16.7 thousand cubic feet per day (MCFD). Of the total marginal gas wells, the same percentage as last year, 1.5 percent or 4,517 wells were plugged and abandoned in 2005. Given the higher prices for both oil and gas, and the growing maturity of gas production, the changes in marginal well counts and plugging activity are in line with expectations.

*Oil wells in survey states averaged 2.7 barrels of oil per day (BOPD), better than the overall national average of 2.2 BOPD.*

	Number of Marginal Wells	2005 Abandonments
<i>Subtotal</i>	<i>420,373</i>	<i>14,950</i>
All Others	269,597	2,832
<b>Total U.S.</b>	<b>689,970</b>	<b>17,782</b>

# wellhead prices

Wellhead prices shown in Table 2 are derived from data gathered directly from the various state agencies and the U.S. Department of Energy's Energy Information Administration (EIA).

These statistics show the weighted average wellhead price was \$51.14 per barrel of oil, versus 2004's average of \$37.83 per barrel. The average price for gas was \$7.51 per Mcf, versus 2004's average of \$5.41 per Mcf.

In this year's report, state-by-state wellhead oil prices were available from the EIA, but not for natural gas.

Estimates for state gas prices were determined using the ratio of state to national prices observed from the EIA's 2004 data and applied to the EIA's 2005 nationwide wellhead gas price estimate of \$7.51.

Production from Alaska and Federal Offshore areas (OCS) were excluded from the analysis since there is essentially no marginal production from these areas and the large volume of their production tends to skew the data. This accounts for the difference in total U.S. price as shown in this report, \$7.44, and the EIA nationwide wellhead price.

**Table 2: 2005 Wellhead Prices**

State	Total Oil Value \$ x 1,000	Total Oil Production BBL x 1,000	Weighted Average Wellhead \$/BBL	Total Gas Value \$ x 1,000	Total Gas Production MCF x 1,000	Weighted Average Wellhead \$/MCF

\* Excludes Alaska and Federal Offshore production.

# effects of abandonment

The values from Tables 1 and 2, Tables 3A and 3B show the gross value associated with marginal wells. Assuming the average marginal well producing rates for each state, Table 3A shows the oil and gas wells plugged and abandoned in the survey states during 2005 would have produced oil and gas valued at \$810.5 million. The total value of oil and gas lost due to abandonments during 2005 for all states was \$883.4 million.

It should be noted that, by attributing the average production rates of existing wells to abandoned wells, the actual productivity of abandoned wells may be slightly overstated. While no data was found to estimate the average production rates at the time of abandonment, the IOGCC and U.S. DOE estimate the range is between one and two BOPD, and the equivalent rate of 10 to 20 MCFD is assumed for gas wells.

To illustrate the overall economic impact on the U.S. economy, Table 3B assumes the abandonment of all marginal wells. This shows a theoretical loss value of \$23 billion for the survey states or \$29.5 billion for the total United States in 2005.

If the marginal oil and gas production represented in Table 3B were indeed lost to the United States, this would represent more than 8.8 million barrels of oil and 4.8 Bcf of gas each day. Using the weighted average wellhead prices for marginal production, the daily amount that would have to be spent on imports would be \$81 million.

In 2005, American Petroleum Institute (API) statistics show that we imported 4.8 billion barrels of crude oil and products. If the oil production from marginal wells active in 2005 did not exist, imports would have increased 6.7 percent to make up for the shortage. EIA statistics show that 2005's total marketed gas production was 19,145 Bcf. (Note: this figure includes federal offshore gas production.)

Marginal gas wells contributed 9.2 percent of the total production. EIA statistics also show the total of 2005 natural gas imports was 4,326 Bcf, an amount equal to 22.6 percent of natural gas production. If marginal gas wells did not exist, imports to make up the shortage would bring the level up to 31.8 percent of production.

*If oil production from marginal wells active in 2005 did not exist, imports would have increased 6.7 percent to make up for the shortage.*

## Table 3A: Effect of 2005 Abandonments

3 A.1: Oil

In 2005, the United States lost more than \$883 million in revenue from marginal wells left abandoned.

State	Number of Marginal Wells	Production From Marginal Wells (Bbls.)	Wells Abandoned	Average Daily Production Per Well - BOPD

# RIMS II multipliers

Until 2003, this report was based on RIMS II multipliers provided by the Bureau of Economic Analysis (BEA) for industry number 8.0000, Crude Petroleum and Natural Gas. Since then, revised multipliers based on the BEA's 1997 national and 2001 regional accounts are used.

The RIMS II multipliers based on this updated work were first released in May 2004. The multipliers have been re-categorized to Industry 211000, Oil and Gas Extraction. A comparison of these new factors against the old shows the overall multiplication effect has on average increased for output and earnings for all of the survey states. However, the employment, while up on average, is not up for all states.

The basic implication of these changes is the economic activity generated by marginal well production has a larger impact on the U.S. economy under the revised multipliers, assuming no change in price levels. The magnitude of that impact is dependent on the prices received for the oil and gas.

The multipliers are shown in Table 4. The Final Demand Multipliers shown in the first three columns represent the total economic impact on the region relative to a change in demand of the output, which, in this case, is expressed as the value of marginal oil production.

The same oil and gas values can be used to determine the total impact on earnings and employment for the region. These final demand multipliers include output, earnings and employment not only within the crude petroleum and natural gas industry, but also from secondary interrelated industries that are impacted in the region.

Examples of these secondary sectors could be non-oil-field equipment manufacturers, local retailers and health care professionals that provide goods and services to both the oil sector and other sectors. Please refer to the Appendix for a more complete discussion about RIMS.

The direct effect multipliers shown in the fourth and fifth columns represent the total impact relative to a

*Numbers from this analysis are revised multipliers based on the BEA's 1997 national and 2001 regional accounts.*

direct change in household earnings or employment. They are used whenever changes in household earnings or employment are known.

As presented, they are not directly applicable for the purposes of this study. However, they represent the ratio

between the industry specific multiplier and the final demand multiplier. This relationship allows the calculation of earnings and employment multipliers for the oil and gas industry alone (sixth and seventh columns), without regard to the earnings and employment levels of any secondary industries.

**Table 4: 2005 RIMS II Multipliers**

State	Final Demand Multipliers			Direct Effect Multipliers		Calculated O&G Industry Multipliers

# U.S. economic impact

Tables 5A and 5B show the economic impact of marginal oil and gas production. Using the values determined from Table 3A and the multipliers from Table 4, Table 5A shows the 17,782 marginal oil and gas wells plugged and abandoned in 2005 resulted in a reduction of total economic output of \$1.77 billion, earnings reductions of \$368 million and lost employment of 8,604 jobs.

In 2005 the oil and gas industry alone lost \$154 million

of earnings and 2,577 jobs to the marginal well abandonments of the previous year.

Table 5B shows the economic impact of the theoretical abandonment of all marginal oil and gas wells. Economic output would decline by \$58.2 billion, earnings would decrease by \$11.9 billion, and 291,808 jobs would be lost. Within the oil and gas industry alone, \$5.08 billion of earnings and 88,855 jobs would be lost.

## Table 5A: Economic Effects of 2005's Abandonments

output*

# severance and ad valorem tax

RIMS II multipliers do not take into consideration any impact on state or local government. Therefore, the economic impact predictions do not include any payments of state or local severance taxes or any local ad valorem taxes.

Many states have reduced severance tax rates for wells that qualify for stripper or marginal status under their guidelines. For the purposes of this report, it was assumed that all of the marginal production reported for a

given state would qualify for stripper/marginal status tax reductions at the lowest level of status granted. No additional tax reductions for secondary or tertiary production were assumed for the states that grant such reduction.

Several states have additional taxes levied on production for the purpose of funding conservation, environmental or maintenance related activities. These taxes have been included in the severance tax calculations. Based on average oil and gas prices and marginal production from Table

**Table 6: Production Taxes**

6, severance taxes collected for marginal production were about \$1.2 billion during 2005. Furthermore, the production loss from marginal oil and gas well abandonments in 2005 would represent a \$32.9 million loss in severance taxes assuming average marginal production rates.

Ad valorem taxes are property taxes assessed by local government entities, and a marginal well may be subject to multiple overlapping taxing entities. As noted in prior reports, a survey of ad valorem taxation approaches in oil

and gas producing states shows the tax assessment process differs widely among the states and sometimes also within a state, with corresponding varying tax rates. While we are not aware of any published data that allows a reasonable estimate for marginal well ad valorem tax expense, our experience suggests that the ad valorem tax expense is probably a value of similar magnitude to the severance taxes.

*Note: Many states have different or multiple production level cut-offs in determining marginal status. The rates shown below assume the lowest tax applicable to a marginal well producing at the lowest production level cut-off. Source: www.spee.org.*

# conclusion

The results of this study serve to quantify the economic impact of marginal oil and gas well production on the U.S. economy.

In 2005, total domestic production, including Alaska and the federal offshore areas, was 1.87 billion barrels of oil and 19.14 trillion cubic feet of gas. Marginal oil production accounted for 322 million barrels or 17.2 percent of total oil. Marginal gas production accounted for 1.76 Tcf or 9.2 percent of total gas production.

The use of RIMS II multipliers show that every dollar of marginal oil and gas production creates an additional \$1.00618 of economic activity throughout the economy, and that 9.7 jobs are dependent on every \$1 million of marginal oil and gas produced. Price levels for oil and gas and foreign country political instability are such that some companies that had focused their attention on foreign ventures have either returned or are increasing their activities in the United States. The large companies have continued their merger and consolidation process.

However, this will bring new opportunities for marginal production as the large companies optimize their property holdings to pay for the merger activity and sell the smaller, non-core assets. The high prices have also spurred activity in areas and formations that are low in productivity.

This year's report saw the total number of marginal wells to be up over 20,000 from last year. We should expect the level of marginal wells to grow at a faster trend, not only from natural production declines, but in recognition that producers are drilling more wells with less initial productive capacity.

The cumulative impact of marginal production over the 14 years this economic report has been prepared is summarized in Table 7 – 7.07 billion barrels of oil equivalent production has been achieved from these marginal producers. The lost output of the wells abandoned during this time would have represented \$9.7 billion of economic activity and more than 50,000 jobs.

*During the past 14 years, states lost more than \$221.6 million in severance taxes from abandoned marginal wells.*

# appendix: RIMS background

The U.S. Department of Commerce's Bureau of Economic Analysis prepares regional input-output multipliers that allow the estimation of the total economic impact of the addition or removal of industries or projects to a given region. The IOGCC's annual Marginal Well Report uses these multipliers to investigate the economic impact of marginal well production on 11 states and extrapolates those findings to determine the economic impact of marginal oil and gas well abandonments to both the overall economy and the oil and gas industry specifically.

Recognizing the need for a basis of estimating the economic impacts of projects and programs on a regional basis, the Bureau of Economic Analysis developed RIMS (Regional Industrial Multiplier Systems) in the mid-1970s. Enhancements to RIMS in the mid-1980s led to RIMS II (Regional Input-Output Modeling System).

RIMS II multipliers show the interdependence of economic activity throughout a given region, where a region comprises one or more counties. Multipliers are provided for output, earnings and employment, considering final demand and direct effect. These multipliers plus assumptions of projects or programs introductions into a region can be used to calculate variables such as the increase in the output value, i.e. gross receipts or sales. Multipliers plus assumptions are also instrumental in calculating earnings income such as wages,

salaries or proprietor's income less any contributions to private pension funds, and employment levels for all other industries in that region.

In some situations RIMS II multipliers have certain limitations. For instance, the multipliers are best used when total demand changes are relatively small compared to the economy of the region under consideration. Interrelations with adjacent regions are another potential source of error when the regions under consideration are small. The multipliers do not consider the possible subsequent incremental economic activity that may be associated with economic impacts of considerable relative magnitude to a region, although if such activity can be predicted, the RIMS II multipliers can be added for the expected activity to show a cumulative effect. Demand substitution can affect the RIMS II estimates, in that the multipliers assume an adequate supply of resources and labor exists within the region under study. The multipliers are static in the sense that the changes predicted are overall changes with no regard to the timing. The multipliers estimate short-term economic effects that often change over the long term. For example, multipliers may overstate job losses in the long term, as displaced employees find new jobs.

Since RIMS II multipliers are limited to the private sector, they exclude the economic impacts on state and local governments. For the proper consideration of economic

impact from marginal oil and gas production, state severance taxes and local and ad valorem taxes must be added to any estimates derived from RIMS II.

The U.S. Department of Commerce Bureau of Economic Analysis was able to provide the RIMS II multipliers for the 12 largest oil producing states: Alaska, California, Colorado, Kansas, Louisiana, Mississippi, New Mexico, North Dakota, Oklahoma, Texas, Utah and Wyoming. However, Alaska has no marginal well production reported. Its inclusion in U.S. production statistics can significantly skew the analysis results, due to the large volume of North Slope production with its corresponding low wellhead value. Therefore, Alaska is excluded in the IOGCC analysis. The remaining 11 states used for this study (referred to as the “survey states”) account for the majority of marginal oil and gas production. Average values applied for the remaining states reflect weighted averages.

The use of state level RIMS II multipliers is most accurate when the economic activity is evenly distributed across the state. This appears to be a reasonable assumption for the majority of the states considered in this study. In California, the oil and gas industry is not evenly distributed and significant other economic activity is present. These factors suggest that the potential for error in the RIMS II estimate is greater for states such as California, whereas accuracy should be better in states

with more evenly geographically distributed production, such as Louisiana.

Since the RIMS II multipliers used for this study are aggregations of regional data at the state level, it is expected that any errors introduced by the limitations previously discussed will be minimized. While RIMS II does not consider timing, many of the effects predicted in this report are based on annual values. It would follow that some portions of the predicted areas impacted, such as annual severance tax collections, could be considered as time dependent.

All previous editions of this report utilized RIMS II factors that were calculated from data gathered in the late 1980s. The U.S. Department of Commerce released updated RIMS II factors in April 2004, and these updated factors were used in this report. The old factors were aggregated into industry 8.000, Crude Petroleum and Natural Gas. The new factors are grouped into Industry 211000, Oil and Gas Extraction. The new factors are generally higher than the old factors, showing that the industry activity has a larger impact on the overall economy than what would have been calculated using the old factors. Because of the time interval between the development of the multipliers and the possible changes in the scope of what is encompassed in the industry category, it cannot be determined to what extent the old multipliers are directly comparable with the new.

## IOGCC Contributors

Special thanks to IOGCC contributors Charles E. Bowlin and Lee Hull whose combined dedication to the organization has made the Marginal Well Report possible for more than 45 years.

Charlie worked as director of technical services for the IOGCC beginning in 1970. In 1971 he took responsibility of assembling the data for the report and has been involved with its production each year since.

Lee began working for the IOGCC in 1954, serving as executive secretary to various Commission directors. She has assisted in the compilation of data for the Marginal Well Report since the late 1950s.

## Oklahoma Commission on Marginally Producing Oil and Gas Wells

The IOGCC would also like to thank the Marginal Well Commission for its generous financial contribution to a portion of the research involved in this report.

# abbreviations

## Oil

bbls = barrels

Mbbls = one thousand barrels (1,000 barrels)

MMbbls = one million barrels (1,000,000 barrels)

BOPD = barrels of oil per day

BOEPD = barrels of oil equivalent per day

MMBOE = million barrels of oil equivalent (1,000,000 barrels of oil equivalent)

## Natural Gas

Mcf = one thousand cubic feet (1,000 cubic feet)

Bcf = one billion cubic feet (1,000,000,000 cubic feet)

MCFD = one thousand cubic feet per day (1,000 cubic feet per day)

MMCF = one million cubic feet (1,000,000 cubic feet)

MMCFD = one million cubic feet per day (1,000,000 cubic feet per day)
