# Urban Oklahoma Health Industry and All Industry Employment and Earnings: A Trend Analysis Comparison of Change by Age and Gender, 2001 to 2017 

## EXECUTIVE SUMMARY

The following study is a trend analysis of employment and earnings in ambulatory healthcare services (NAICS 621), hospitals (NAICS 622), and nursing and residential care facilities (NAICS 623) industries using data from the Longitudinal Employer-Household Dynamics (LEHD) program.

## Major Findings for Employment and Employment Change

- In the three industry groups of all industries, hospitals, and nursing and residential care facilities looking at the three gender groups and the eight age groups the two age groups highest in 2021 employment are in ages 25 to 34 and 35 to 44. These same age groups are highest for both genders and females in ambulatory health care services. However, males in ambulatory health care services have their highest employment in ages 35 to 44 and 45 to 54 .
- The two health industry groups of ambulatory health care services and hospitals for both genders, males and females have either their largest or second largest employment change in age group 35 to 44; while the same three gender groups have either their largest and second largest employment change in all industries and nursing and residential care facilities in the two oldest age groups of 65 to 99 and 55 to 64, respectively.
- Likely the most important employment finding in this analysis in urban Oklahoma of the eight age groups in both genders, males, and females: n the three health industries the age group with the largest employment rate of change is ages 65 to 99 , with males' rate of change higher than that of females.
- While the ratio of males to female employment in all industries is almost 1 to 1 , in the three health industries, the ration of females to males' range is 3.5 to 3.8 ratios.

## Major Findings for Earnings and Earnings Change

- In the four industry groups and the three gender groups the two age groups with the largest 2021 earnings are most often ages 45 to 54 and 55 to 65 . The two exceptions to this are females in ambulatory health care services and males in hospitals that have only their largest 2021 earnings in the one of these two age groups, that of ages 45 to 54 .
- In the four industry groups examined the most common age group for the three gender groups to have one of their two largest 2012 to 202110 year earning change is ages 45 to 54 , with the two exceptions of males and females in ambulatory health care services.
- The eight age groups and in both gender, males, and females the age group with the largest or second largest earnings rate of change most often is in ages 65 to 99 . The exceptions are males in all industries, and hospitals.
- The ratio of male to female industry earnings in year 2021 is 1.5 to 1 in all industries, 2.7 in ambulatory health care services, 1.5 in hospitals and 1.1 to 1 in nursing and residential care facilities.

## Conclusions

The analysis and findings allow three conclusions:

- Urban Oklahoma female health industry group employment outnumbering male employment will likely continue for some time into the future, as indicated by their current larger than male ratio in all three health industry groups, even with the male employment change rate higher than female in the three health industry groups.
- Females' traditionally lower than males' earnings have the probability of reaching earnings parity at varying rates in each of the three-health industry groups; as indicated by the huge in difference in male to female earnings in ambulatory health care services, and hospitals, and the near parity in male to female earnings in nursing and residential care facilities; as modified by the rapid changing rate for females in ambulatory health care services, the relative low earnings change rates for females in hospitals and the lower earrings change rates for females compared to that of males in nursing and residential care facilities.
- Urban Oklahoma health industry staffing, which has historically been problematic and presently still is the case, likely will increasingly be so in the future, as indicated by both gender's employment more rapid increase in the older two age groups and relatively lower employment 10-year increase in some of the three health groups four younger age groups.

# Urban Oklahoma Health Industry and All Industry Employment and Earnings: A Trend Analysis Comparison of Change <br> by Age and Gender, 2012 to 2021 

## I. Introduction

This report on urban Oklahoma health industry is the second in the series and covers two of Oklahoma's urban areas, specifically a combination of Oklahoma City and Tulsa Oklahoma Metropolitan Statistical Areas (MSA). The first covering all of Oklahoma was published on our OESC website in August 2021 at: https://oklahoma.gov/content/dam/ok/en/oesc/documents/labor-market/publications/health-industry-analysis/oklahoma-health-industry-2021.pdf. The Oklahoma and Urban health industry reports are both updates, on prior ones we published in December 2018 and July 2019 at:
https://oklahoma.gov/oesc/labor-market/resources/publications.html .
The following analysis uses data from the Longitudinal Employer-Household Dynamics (LEHD) program, which is part of the Center for Economic Studies at the U.S. Census Bureau. The data refers to the first three subsectors of the healthcare and social assistance sector as defined by the North American Industry Classification System (NAICS). Because this sector consists of ambulatory healthcare services (NAICS 621), hospitals (NAICS 622), nursing and residential care facilities (NAICS 623), and social assistance (NAICS 624), and that the latter is excluded from our analysis, we do not use the term 'health care sector' in this report of our findings. Our analysis of health care employment and earnings refers to NAICS 621, 622, and 623 in these two MSA in a comparison with those of an aggregate of Oklahoma industries, the former three are referred to as industry groups, and the latter is referenced as 'all industry' in this report.

This analysis and report cover a 10-year interval annually, for years 2012 through 2021 for tables and 1st 2011 quarter through the 2nd quarter 2020 for charts. This is reported in 32 tables and 88 charts in eight appendices. These appendices can be viewed at the end of this report.

## II. Employment and Employment Change by Age Group

On the next page, Table 1e shows the urban Oklahoma all industry average annual employment by eight age groups and a ninth aggregate of all ages (ages 14 to 99) for the 10 years, 2012 through 2021. For 'all ages' (14 to 99) the average annual employment increased 26,903, from 991,815 in 2012 to $1,018,718$ in 2021. During this time, six age groups increased in employment, two decreased. Age group ages 65 to 99 increased the most and age group 35 to 44 increasing the second in size.

Additionally on the next page, Chart 2 e shows the employment for all industries for the four oldest age groups, as indexed to 1st quarter 2011 as being equal to 100, with all ages, years 14 to 99 , as a comparison. Indexed data are handy because they allow an observer to quickly determine rates of growth by looking at a chart's vertical axis. They also allow for comparison of variables with different magnitudes.

Chart 2e shows that urban Oklahoma's all industry employment for the oldest age groups of 65 to 99 years, grew rapidly over the 10 years. The other four younger age groups ages 14 to 34 are not shown but may be seen in Chart 1 e in Appendix E. The latter chart shows that of the youngest three age groups, ages 14 to 18 grew the second most in employment in most quarters over the 10 years studied.

Table 1e. Urban Oklahoma: All Industries
Annual Average Employment by Age Group

Note: Using Beginning of Quarter Employment Counts.

Chart 2a. Urban Oklahoma: All Industry Four Quarter Moving Average Employment by All Ages (14 to 99) and Age Groups 35 to 99 Years Old Index: Q1/2011 = 100

Table $2 e$ displays the average annual employment for urban Oklahoma ambulatory health care, with the two groups with the largest 2021 employment in age groups, 35 to 44 years old and 25 to 34 years old. Considering employment change, in Table 2e the largest employment increase is in the middle age group of ages 35 to 44 and the second largest amount of employment increase middle age group 25 to 34, over the 10 years. The employment of the two youngest age groups increased the least of all eight groups.

Note: Using Beginning of Quarter Employment Counts.

On the top of the next page, Chart 4a of urban Oklahoma ambulatory health care services shows that the employment in the oldest ages 65 to 99 grew the fastest and age group ages 35 to 64 grew the second fastest of the eight age groups in this industry. These two age groups also grew faster than their counterparts in all industries, as shown on the previous page in Chart 2a. The younger four urban age groups for ambulatory health care services are in Chart 3a, which may be viewed in Appendix E at the end of this report.

At the bottom of the next page, Table 3e reveals annual average hospital employment from 2012 through 2021. The table shows that the employment of all ages grew by 2,727. In year 2021, the age group ages 25 to 34 have the largest employment and age group ages 35 to 44 have the second largest hospital employment, Age group ages 35 to 44 grew the most of the eight age groups, and age group ages 65 to 99 grew the second most over the decade. Age group 45 to 55 decreased in employment over the decade.

Table 3e. Urban Oklahoma: Hospitals Annual Average Employment by Age Group

|  | Employee Age Group |  |  |  |  |  |  |  |  |  |

Note: Using Beginning of Quarter Employment Counts.

Chart 6a displays the hospital employment for the four oldest age groups, ages 35 to 99, during the 10 years of examination. This chart shows those ages 65 to 99 display a dramatic increase over the 10 years of observation of over 58 percent. The employment for age group ages 45 to 54 as shown in this chart shows a decrease of over 13 percent. The employment for the four younger age groups in urban Oklahoma is not shown, but may be viewed in Chart 5e, Appendix E. Three of the age groups in the latter show a slight increase, and age group ages 14 to 18 decreased over 42 percent.

On the next page, Table 4e shows the average annual employment for urban Oklahoma nursing and residential care facilities for eight age groups and an aggregate of all ages (ages 14 to 99) for the years 2012 to 2021. The table shows that in 2021 ages 35 to 44 have the largest employment and ages 25 to 34 have the second largest employment. The table also shows that ages 65 to 99 have the largest increase in employment and ages 55 to 64 have the second largest increase in employment. In nursing and residential care facilities, all ages (ages 14 to 99 ) decreased by 1,412 , over the 10 years of observation.

At the bottom of the next page, Chart 8 e illustrates urban Oklahoma nursing and residential care facilities employment for the four older groups, from 2012 to 2021. The two oldest groups, ages 55 to 64 and ages 65 to 99 , grew the second and first fastest rates, respectively, over the 10 -year time. The four other age groups in this industry are shown in Appendix E Chart 7e, age group ages 14 to 18 grew at much slower rate with the other three age groups decreasing in employment in the same interval.

Table 4e. Urban Oklahoma: Nursing and Residential Care Facilities Annual Average Employment by Age Group

| Year | Employee Age Group |  |  |  |  |  |  |  |  |

Note: Using Beginning of Quarter Employment Counts.

Chart 8a. Urban Oklahoma: Nursing and Residential Care Facilities Four Quarter Moving Average Employment by All Ages (14 to 99) and Age Groups 35 to 99 Years

In summary of Section II, urban Oklahoma all industry, ambulatory health care services, and nursing and residential care facilities have its largest 2021 employment in ages 35 to 44 and its second largest employment in ages 25 to 34. Hospitals have the same two age groups with their largest employment, only with the rank reversed.

Employment change amount is examined for the four industry groups by comparing the eight age groups employment change for the 10 years, 2012 to 2021. All industries and nursing and residential care facilities groups have their largest employment change in ages 65 to 99, while hospitals and ambulatory health care services have their largest change in ages 35 to 44 . All industries have its second largest employment change in age group ages 35 to 44, ambulatory health care services have their second largest change in ages 25 to 34, hospitals have their second largest change in ages 65 to 99, and nursing and residential care facilities have their second largest employment change in ages 55 to 65, over the decade of observation.

Employment change rate is evaluated by calculating and charting the indexed four industry groups' four quarter moving average employment over the 10 years, 2012 to 2021. For all four urban Oklahoma industry groups, the highest rate of employment increase is in ages 65 to 99 . The second highest rate of employment increase for all industries is ages 14 to 18, for all industries, for ambulatory health care services the second highest is ages 35 to 44 , for hospitals is ages 19 to 21 and for residential care facilities the second highest rate of employment change was 55 to 64 , over the decade observed.

## III. Earnings and Earnings Change by Age Group

Of explicit interest to employers, policy makers, career advisors, students and other health industry stakeholders is the amount of earnings and earnings change that has occurred in the industry over time. This section explores these two topics for health industry groups by age group, beginning with an aggregate of Oklahoma all industry for comparative purposes.

On the next page, Table 1 f reveals urban Oklahoma all industry average monthly earnings by eight age groups, and an aggregate of all age groups (ages 14 to 99), from 2012 to 2021. The table confirms that in year 2021 the larger earnings are in ages 55 to 64 and ages 45 to 54. Ages 45 to 54 have the largest amount of earnings change and ages 35 to 44 have second largest earnings increase over the 10 years of analysis. The younger three age groups of ages 14 to 18,19 to 21 and 22 to 24 have much lower average monthly earnings increase amounts than the other five age groups, during this period.

Chart 2 b displays the earnings change for urban Oklahoma all industries, the older four age groups and all ages (age 14 to 99). The oldest age group, ages 65 to 99, have the largest rates of earnings change, with 35.8 percent increase. Not shown here, but available in Appendix F, Chart 1b for the youngest four age groups, shows that four youngest out of eight age groups all have earnings increases of 20.1 to 29.7 percent, the latter in age groups ages 19 to 21 .

Table 1f. Urban Oklahoma: All Industries Average Monthly Earnings by Age Group

|  | Employee Age Group |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Note: Using Beginning of Quarter Employment Counts.

Table 2f, provides urban Oklahoma ambulatory health care services average monthly earnings by eight age groups, compared to all age groups (ages 14 to 99). The table shows that in 2021 ages 45 to 54 have the largest earnings of \$6,110 and ages 55 to 64 have the second largest average monthly earnings of $\$ 6,066$. The table shows that age group ages 65 to 99 have the largest earnings change and age group ages 45 to 54 have the second largest earnings change, over the 10 years surveyed.

On the top of the next page, Chart 4 b illustrates the urban Oklahoma ambulatory health care services earnings change rates for the older four age groups, as compared to all ages ( 14 to 99 years). The chart shows that ages 65 to 99 have the highest rate of earnings change of these four older age groups and age group ages 35 to 44 have the second highest rate of earnings change. Not shown here, but available in Appendix F, Chart 3b for the youngest four age groups, shows that four younger out of eight age groups 14 to 18,19 to 21,22 to 24 and ages 25 to 34 all have earnings increases of 27.1 to 29.7 percent.

At the bottom of the next page, Table 3f shows the urban Oklahoma hospitals average monthly earnings by eight age groups and by all ages ( 14 to 99 years). The table confirms that in 2021 hospital employment in ages 45 to 54 and ages 55 to 64 have the two highest average monthly earnings of $\$ 5,425$ and $\$ 5,131$, respectively. Age group ages 45 to 34 also have the largest earnings change, while age group ages 35 to 44 showed the second largest amount of earnings change, over the 10 years.

## Table 3f. Urban Oklahoma: Hospitals

Average Monthly Earnings by Age Group

|  | Employee Age Group |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 2021 | \$4,600 | \$1,408 | \$1,602 | \$2,692 | \$3,751 | \$5,059 | \$5,425 | \$5,131 | \$5,002 |
| 2012-2021 | \$935 | \$457 | \$327 | \$636 | \$815 | \$1,109 | \$1,284 | \$688 | \$993 |

Note: Using Beginning of Quarter Employment Counts.

On the next page, Charts 5 b and 6 b display the rates of hospital earnings change over the decade.

At the top of the previous page, Chart 5b displays urban Oklahoma hospitals earnings change for the youngest four of eight age groups, ages 14 to 34 , while at the bottom of the same page, Chart 6 b shows the earnings change for the oldest of the eight age groups. The earnings for ages 14 to 18 grew at the second highest of the eight groups at 37.1 percent, while age group ages in the bottom chart age group ages 65 to 99 grew at the fastest rate of 37.4 percent.

## Table 4f. Urban Oklahoma: Nursing and Residential Care Facilities Average Monthly Earnings by Age Group

| Year | Employee Age Group |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{array}{\|c\|} \hline \text { All Ages (14 } \\ \text { to 99) } \\ \hline \end{array}$ | $\begin{array}{\|c\|} \hline \text { Ages } 14 \text { to } \\ 18 \\ \hline \end{array}$ | $\begin{array}{\|c} \hline \text { Ages } 19 \text { to } \\ 21 \\ \hline \end{array}$ | $\begin{array}{\|c} \hline \text { Ages } 22 \text { to } \\ 24 \\ \hline \end{array}$ | $\begin{array}{\|c\|} \hline \text { Ages } 25 \text { to } \\ 34 \\ \hline \end{array}$ | $\begin{gathered} \hline \text { Ages } 35 \text { to } \\ 44 \\ \hline \end{gathered}$ | $\begin{gathered} \hline \text { Ages } 45 \text { to } \\ 54 \\ \hline \end{gathered}$ | $\begin{array}{\|c} \hline \text { Ages } 55 \text { to } \\ 64 \\ \hline \end{array}$ | $\begin{array}{\|c\|} \hline \text { Ages } 65 \text { to } \\ 99 \\ \hline \end{array}$ |
| 2012 | \$2,029 | \$731 | \$1,069 | \$1,367 | \$1,798 | \$2,258 | \$2,349 | \$2,524 | \$1,974 |
| 2013 | \$2,049 | \$757 | \$1,095 | \$1,354 | \$1,817 | \$2,269 | \$2,391 | \$2,505 | \$2,050 |
| 2014 | \$2,109 | \$746 | \$1,119 | \$1,381 | \$1,864 | \$2,315 | \$2,477 | \$2,558 | \$2,125 |
| 2015 | \$2,187 | \$744 | \$1,129 | \$1,383 | \$1,937 | \$2,372 | \$2,600 | \$2,644 | \$2,180 |
| 2016 | \$2,203 | \$810 | \$1,183 | \$1,378 | \$1,923 | \$2,370 | \$2,620 | \$2,666 | \$2,205 |
| 2017 | \$2,225 | \$799 | \$1,201 | \$1,442 | \$1,938 | \$2,419 | \$2,624 | \$2,651 | \$2,226 |
| 2018 | \$2,288 | \$933 | \$1,273 | \$1,487 | \$2,005 | \$2,473 | \$2,686 | \$2,663 | \$2,330 |
| 2019 | \$2,361 | \$906 | \$1,290 | \$1,551 | \$2,056 | \$2,570 | \$2,783 | \$2,738 | \$2,378 |
| 2020 | \$2,594 | \$1,119 | \$1,440 | \$1,721 | \$2,258 | \$2,856 | \$3,074 | \$3,006 | \$2,507 |

| 2012-2021 | \$606 | \$406 | \$348 | \$369 | \$445 | \$646 | \$902 | \$484 | \$496 |

Note: Using Beginning of Quarter Employment Counts.

Table 4 f exhibits the average monthly earnings of urban Oklahoma nursing and residential facilities, as shown by eight age groups and as compared to an aggregate of all ages, ages 14 to 99 . The table shows that ages 45 to 54 and 55 to 64, have the largest and second largest 2021 average monthly earnings, respectively; of $\$ 3,251$ for the former and $\$ 3,008$ for the latter. Age group ages 45 to 54 also have the largest earnings change, while age group ages 35 to 44 showed the second largest amount of earnings change, over the decade of observation.

At the top of the next page, Chart 7b displays urban Oklahoma nursing and residential facilities earnings change for the youngest four of eight age groups, ages 14 to 34 , while at the bottom of the same page, Chart 8 b shows the earnings change for the oldest four of the eight age groups. Chart 7b, displays that the earnings for ages 14 to 18 grew at the second highest of the eight groups at 31.0 percent, while age group ages in the bottom Chart 8 b shows that age group ages 65 to 99 grew at the fastest rate of 34.9 percent.

In summary of Section III, the analysis of urban Oklahoma health average earnings by four industry groups and age groups in year 2021 determined that of the eight age groups, 45 to 54 having the largest earnings, and ages 55 to 64 having the second largest earnings, the exception being all industries where the rank earnings are reversed.

Average monthly earnings change amounts for years 2012 to 2021 is also calculated for all four industry groups by eight age groups and the aggregate of all ages. It was found that all industries, hospitals and nursing and residential care ages 45 to 54 have the largest earnings change and ages 35 to 45 have the second largest earnings change. In ambulatory health care services, the largest earnings change is in ages 65 to 99 , and ages 45 to 54 with the second largest earnings change, over the decade surveyed.

The four quarter moving averages earnings change rate was calculated and charted for the four industry groups by eight age groups. In all four industry groups, ages 65 to 99 average earning grew at the highest rate in ages 65 to 99. In hospitals and nursing and residential care age group ages 14 to 18 grew at the second highest rate of earnings change, while in all industries age group ages 19 to 21 grew at the second highest rate, and in ambulatory health care services the second highest earnings rate of change is in age group ages 35 to 34 .

## IV. Employment and Employment Change by Age Group and Gender Group

Another helpful way of exploring health industry employment is by both age and gender concurrently. Traditionally and historically females have the larger portion of employment than males in the health industry. Has this larger female than male portion employed in the health industry changed in recent years? Below Table 6e displays urban Oklahoma all industry average annual male employment by age.

Table 6e. Urban Oklahoma: All Industries
Annual Average Employment for Males by Age Group

|  | Employee Age Group |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Note: Using Beginning of Quarter Employment Counts.
Table 6e shows that urban Oklahoma all industries in year 2021 have their largest male employment in ages 35 to 44 and their second largest male employment in ages 25 to 34 . On the other hand, all industries have their largest male employment amount increase in ages 65 to 99 and their second largest increase in ages 55 to 65 . All ages ( 14 to 99 ) males decrease in employment by 718, over the 10 years.

Note: Using Beginning of Quarter Employment Counts.
Table 7e displays that in 2021 urban Oklahoma all industries have their largest female employment in ages 35 to 44 and their second largest male employment in ages 25 to 34 . All industries have their largest female employment amount increase in ages 35 to 44 and their second largest increase in ages 65 to 99 . All ages (14 to 99) females increase in employment by 27,621 , over the decade of observance.

At the top of the next page, Chart 10a shows all industry employment rate of increase in urban Oklahoma for ages 14 to 18 by gender and at the bottom of the same page, Chart 17a show the same for ages 65 to 99; as indexed to 1st quarter 2011 equal to 100. Male employment increased at a rate of about 22.8 percent in the former and just over 54.5 percent in the latter, while female employment rate of increase is almost 20.8 percent in Chart 10e, and a little over 54 percent in Chart 17e, over the 10 years of observation. Charts for the other urban six age groups in all industries are in Appendix G.

Chart 10a. Urban Oklahoma: All Industry Four Quarter Moving Average Employment by Ages 14 to 18 and Gender Group Index: Q1/2011 = 100

Chart 17a. Urban Oklahoma: All Industry Four Quarter Moving Average Employment by Ages 65 to 99 by Gender Group Index: Q1/2011 = 100

Table 9e shows urban Oklahoma ambulatory health care services average annual employment for males by age group; below it Table 10e shows the same for females. The 'all ages' ( 14 to 99) age categories in the two tables confirm a 2021 urban Oklahoma ambulatory health care services average annual employment female to male employment ration of over 3.5 to 1 . The largest employment of urban males in year 2021 is in ages 35 to 44 and the second largest employment of males is in ages 45 to 54 . For females, the largest urban employment is in ages 35 to 44 and the second largest employment is ages 25 to 44 . The largest employment change for males in this industry is in age group ages 45 to 54 and largest change for females is in ages 35 to 44, over the 10 years of observation.

Note: Using Beginning of Quarter Employment Counts.

Chart 26a shows urban Oklahoma ambulatory health care services employment change rates for ages 65 to 99, as the largest in amount of change for males and females as indexed to 1st quarter 2011 equal to 100. Not shown here but shown in Appendix $G$ at the end of this report, the second largest amount for males is 24.7 percent shown in Chart 23a in ages 45 to 54, and the second largest for females is 20.3 percent shown in Chart 22a in ages 35 to 44 . The charts for the remaining six age groups in ambulatory health care services may also be viewed in Appendix G.

On the top of the next page, Table 12e above shows the urban Oklahoma hospitals average annual employment for males by age group, and below it, Table 13e shows the same for females. Note that the yellow shaded cells indicate Aggregate of cells not released because component cells do not meet U.S. Census Bureau publication standards. Males have their highest 2021 employment in ages 35 to 44 and in their second highest employment in 25 to 34 . Females have the same two age groups of highest 2021 employment, only with the rank reversed. Also in 2021, female hospital employment in 'all ages' (14 to 99) is over three and a half times that of males in all ages.

The age group with the highest change for Oklahoma hospital males is ages 65 to 99, and the second largest is ages 35 to 44 . For females age group ages 35 to 44 have the largest change and ages 22 to 24 has the second largest change, over the decade of observation.

Note: Using Beginning of Quarter Employment Counts.
At the top of the next page, Chart 34a illustrates urban Oklahoma hospital employment change for ages 55 to 64 by gender group; while beneath it Chart 35a does the same for age group 65 to 99 , as indexed to 1st quarter 2011 as being equal to 100 ; with 'all ages' 14 to 99 , as a comparison.

Chart 35a reveals the highest rates of annual average monthly employment change for both hospital males and females of ages 65 to 99 as over 93.4 percent and 48 percent, respectively, while Chart 34 f displays second highest rate of hospital males in ages 55 to 64 as 5.8 percent, over the 10 years of analysis. Not shown here, but provided in Appendix H, Chart 29a displays the second highest rate of hospital females’ employment change rate of 22.6 percent, in ages 19 to 21.

Table 15e exhibits urban Oklahoma nursing and residential care facilities annual average monthly employment for males by age group. Below it, Table 16e displays the same for females. In year 2021 females all ages 14 to 99 years employment is 3.8 times that of males. In that same year, both males and females in ages 35 to 44 have the largest employment, with ages 25 to 34 displaying the second largest employment. Both males Females have their first and second largest employment amount increases in age groups 65 to 99 and ages 55 to 64 , respectively, over the decade of surveillance.

Note: Using Beginning of Quarter Employment Counts.

Chart 44a reveals the highest rates of annual average monthly employment change for both nursing and residential care facilities males and females as ages 65 to 99 of 36.5 percent and 29.8 percent, respectively. Not shown here, but provided in Appendix H, Chart 43a displays the second highest rate of nursing and residential care facilities for male employment change rate of 21.6 percent, in ages 55 to 64 , while Chart 37a of ages 14 to 18 provides the second highest for females as 13.1 percent over the 10 years surveyed. The remaining charts for hospital annual averages monthly employment change rates for the five other age groups by gender are also shown in this appendix.

In summary of Section IV, in 2021 males and females in almost all four industries of all industries, ambulatory health care services, hospitals and nursing and residential care facilities have their two largest employments in ages 25 to 34 and ages 35 to 44, except for males in ambulatory health care services, which have its two highest employment age groups in ages 35 to 44 and 45 to 54 . Although the ratio of males to females is slightly higher than 1 to 1 in all industries, in all three of the health industries the ration is females to males is greater than 3.5, and greater than 3.8 in nursing and residential care facilities.

In this section, the four industry groups in urban Oklahoma are also explored for employment amount change over the 10 -year interval from 2012 to 2021, by gender groups. Both males and females in the industry groups of all industries have their two largest employment change in ages 55 to 64 or in ages 65 to 99. Hospital males have their largest employment increase, and nursing and residential care facilities have their second largest increase in ages 65 to 99 . However, females in hospitals and both males and
females in ambulatory health care services have their highest two age groups of employment change in the lower ages.

Four quarter moving average employment is also indexed to 10 for first quarter 2011 and charted for the four industry groups, eight age groups and the aggregate of all ages by gender group. In all four of the industry groups of all industries, ambulatory health care services, hospitals and nursing and residential care facilities their highest rate of change for the three genders are in the oldest age group ages 65 to 99 , with the second highest most often either in ages 55 to 64 or one of the six younger age groups.

## V. Earnings and Earnings Change by Age Group and Gender Group

A subject frequently mentioned in connection to earnings is the lower earnings of women, as compared to their male counterparts. Since both traditionally and historically, the health industry employs more females, then males, comparison of the earnings of each, in all industry and the health industry has merit.

| 2012-2021 | \$551 | \$132 | \$164 | \$223 | \$310 | \$809 | \$781 | \$547 | \$668 |

Note: Using Beginning of Quarter Employment Counts.

Table 6 f displays that in 2021, all industry males have the highest earnings in ages 55 to 64 , with $\$ 6,489$ annual average monthly earnings; followed by the second highest in ages 45 to 54 of $\$ 6,263$ annual average monthly earnings. The table shows that males experienced the largest amounts of earnings increases in ages 35 to 44 and their second largest in ages 45 to 54, over the decade of study.

On the next page, Table 7 f shows that in 2021 all industry females have the highest earnings in the ages 45 to 54 , with $\$ 3,953$ annual average monthly earnings; followed by the second highest in ages 55 to 64 of $\$ 3,849$ annual average monthly earnings. The table shows that females in age groups ages 45 to 54 have the largest earnings change, and in ages 35 to 44 have their second largest earnings change, over the 10 years of observation.

| 2012-2021 | \$570 | \$130 | \$177 | \$270 | \$470 | \$753 | \$788 | \$676 | \$700 |

Note: Using Beginning of Quarter Employment Counts.

At the bottom of the previous page, Chart 11b illustrates all industry earnings change for ages 19 to 21 by gender group; while below Chart 17b does the same for age group 65 to 99, as indexed to 1 st quarter 2011 as being equal to 100 ; with all ages (14 to 99 ) as a comparison.

Chart 11b show the highest rate of earnings change for male in ages 19 to 21 as 32.8 percent, while Chart 17b shows female highest rate of earnings change in ages 65 to 99 as 43.0 percent, and also shows male second highest rate of earnings change in the same age group as 32.0 percent. Not shown but shown at the end of this report in Appendix H, Chart 14b reveals the second highest earnings rate of change for females as 29.2 percent, in ages 35 to 44 .

On the next page, Table 9f shows urban Oklahoma ambulatory health care services annual average monthly earnings for males by age group; while below it, Table 10f does the same for females. In 2021, males have the largest earnings in ages 55 to 64, and second-largest earnings in ages 45 to 54 . Females have their largest earnings in in ages 45 to 54 , and second largest in 35 to 44 . The largest male earnings are over three times larger than the largest female rank earnings and the second largest male earnings are over 2.7 times their female counterpart earnings. The earnings change over the decade are the largest in age group ages 65 to 99 for both male and females. Ambulatory health care services earnings for males decreased in age group ages 45 to 55 and ages 55 to 64, over the 10 years surveyed.

Note: Using Beginning of Quarter Employment Counts.

At the top of the next page, Chart 20b shows urban Oklahoma ambulatory health care services earnings change rates for ages 19 to 21, as the largest in amount of change for males, and Chart 26b at the bottom of the next page shows the change rates for ages 65 to 99 as the largest earnings change in the eight age groups for females as indexed to 1st quarter 2011 equal to 100. In ages 65 to 99 female earnings changed over 81 percent the largest for the eight age groups. The charts for the other six age groups may be viewed in Appendix H at the end of this report.

Table 12f shows the urban Oklahoma hospitals average annual earnings for males by age group, and below it, Table 13f shows the same for females. Note that the yellow shaded cells indicate Aggregate of cells not released because component cells do not meet U.S. Census Bureau publication standards.

| 2021 | \$4,161 | \$1,351 | \$1,592 | \$2,763 | \$3,626 | \$4,490 | \$4,798 | \$4,676 | \$3,952 |
| 2012-2021 | \$869 | \$331 | \$318 | \$651 | \$764 | \$1,000 | \$1,094 | \$846 | \$1,113 |

Note: Using Beginning of Quarter Employment Counts.

Males have the highest 2021 earnings in ages 45 to 54 and their second highest hospital earnings in ages 65 to 99 . In 2021, male hospital earnings in 'all ages' (14 to 99) is over one-and-a-half times that of females in that age group. Females have their highest 2021 earnings in age 45 to 54 years and second highest in 55 to 64 .

These two tables display that the amount of male hospital earnings change from 2012 to 2021 is highest in ages 45 to 54 and second highest in ages 35 to 44; while female hospital earnings amount of change is highest in ages 65 to 99 and second highest in ages 45 to 54, over the decade.

Chart 33b. Urban Oklahoma: Hospitals Four Quarter Moving Average Earnings by Ages 45 to 54 and Gender Group

Chart 35b. Urban Oklahoma: Hospitals Four Quarter Moving Average Earnings by Ages 65 to 99 by Gender Group Index: Q1/2011 = 100

At the top of the previous page, Chart 33b shows Oklahoma urban hospitals earnings change rate for ages 45 to 54 by gender group, the age group with the highest rate of change for males. Below on this same page, Chart 35b does the same for ages 65 to 99, showing the highest urban hospital earnings rate of change for females, as that age group. Chart 33b displays that male hospital earnings increased over 38 percent and female hospital earnings increased over 29.6 percent in ages 45 to 54 . Chart 35 b displays that male hospital earnings increased almost 16.8 percent and female hospital earnings increased nearly 43.7 percent in ages 65 to 99, from year 2011 to 2020. The remaining 6 age groups may be viewed in Appendix H, at the end of this report.

## Table 15f. Urban Oklahoma: Nursing and Residential Care Facilities Annual Average Monthly Earnings for Males by Age Group

| 2012-2021 | \$675 | \$508 | \$351 | \$467 | \$558 | \$522 | \$1,234 | \$281 | \$436 |

Note: Using Beginning of Quarter Employment Counts.

Table 15 f displays urban Oklahoma nursing and residential care facilities average annual earnings for males by age group and on the next page Table 16 f does the same for urban females. Both males and females have their highest 2021 earnings in ages 45 to 54 and their second highest earnings in ages 55 to 64.

Observing the amount of earnings change over the 10 years, males have their highest amount of earnings change in ages 45 to 54, and their second highest amount of change in ages 65 to 99; while females have their largest amount of earnings change in age group ages 45 to 54 and their second largest earnings change in ages 35 to ages 44 . In 'all ages' ( 14 to 99 ) the ratio of males to female to male earnings in this industry is over a little over 1 to 1 .

Note: Using Beginning of Quarter Employment Counts.

On the previous page, Chart 37b illustrates urban Oklahoma nursing and residential care facilities average earnings change for ages 14 to 18, by gender group. Below, Chart 44b displays the same for ages 65 to 99. Of the eight age groups, Chart 44b shows the highest change for both males and females, at 46.4 percent, and 31.7 percent, respectively. Chart 37b displays the second highest rate of earnings change for both males and females, of over 32.5 percent and 29.7 percent, respectively. Not shown here but shown in Appendix H at the end of this report are this same industry's charts for the other six age groups, exhibiting the earning change rated for both males and females, over the 10 years of observation.

In summary of Section V, in 2021 both males and females in all industry, and nursing and residential care facilities have their two largest earnings in ages 45 to 54 and ages 55 to 64, with males in ambulatory health care services and females in hospitals also having their two largest annual average monthly earnings in these same two age groups. However ambulatory health care services females have their two largest earnings groups in earnings in ages 35 to 44 and in ages 45 to 54, and males in hospitals have their two largest earnings groups in earnings in ages 45 to 54 and 65 to 99, over the 10 years of surveillance.

The ratio of genders earnings in 2021 is 1.5 males to females in all industries, 2.7 in ambulatory health care services, and 1.5 males to females in hospital. In nursing and residential care facilities male earnings is 1.1 to that of females, the only industry where females earning approach that of males.

In this section, the four industry groups in urban Oklahoma are also explored for earnings amount change
over the 10-year interval from 2012 to 2021, by gender groups. Both males and females in all industries, experienced their largest earnings change in age group 35 to 44 and 45 to 54 , with males in hospitals doing the same. Both males and females in ambulatory health care services have their largest earnings change in age group 65 to 99 , as does females in hospitals, with males in nursing and residential care facilities having their second largest earnings change in the latter age group, over the 10 years of observations.

Urban Oklahoma four-quarter moving average earnings change rates are also calculated and charted for the four industry groups for each of the eight age groups and for the aggregate of all ages by gender group, over the 10 years of analysis. In all four industry groups females have their oldest of the eight age groups experiencing the largest earnings rates of change. Females have their second largest earnings change in ages 14 to 18 in the three health industry groups, with females in industries having its second largest earnings change in ages 35 to 44 .

Earnings charted change rate over the 10 years of observation for urban males determined that they also have their largest earnings change in ages 65 to 99 in nursing and residential care facilities, but for all industries and ambulatory health care services males largest earnings change is ages 19 to 21 and for hospitals males largest earnings change is ages 45 to 54 . The second largest earnings change for males in all industries is ages 65 to 99 , for males in ambulatory health care services is ages 45 to 54 , for males in hospitals the second largest age group rate of change is in ages 35 to 44 and for males in nursing and residential care facilities the second largest earnings change rate is in age group ages 14 to 18 .

## VI. Summary of Major Findings and Conclusions

## There are four major findings in this analysis of urban Oklahoma health industry and all industry and employment and employment change:

First, in the three industry groups of all industries, hospitals, and nursing and residential care facilities looking at the three gender groups and the eight age groups the two age groups highest in 2021 employment are in ages 25 to 34 and 35 to 44 . These same age groups are highest for both genders and females in ambulatory health care services. However, males in ambulatory health care services have their highest employment in ages 35 to 44 and 45 to 54 .

Second, the two health industry groups of ambulatory health care services and hospitals for both genders, males and females have either their largest or second largest employment change in age group 35 to 44; while the same three gender groups have either their largest and second largest employment change in all industries and nursing and residential care facilities in the two oldest age groups of 65 to 99 and 55 to 64, respectively.

Third, and likely the most important employment finding in this analysis in urban Oklahoma of the eight age groups in both genders, males, and females: in the three health industries the age group with the largest employment rate of change is ages 65 to 99 , with males’ rate of change higher than that of females.

Fourth, while the ratio of males to female employment in all industries is almost 1 to 1 , in the three health industries, the ration of females to males' range is 3.5 to 3.8 ratios.

There are also four major findings in this analysis of urban Oklahoma health industry and all industry and earnings and earnings change:

First, in the four industry groups and the three gender groups the two age groups with the largest 2021 earnings are most often ages 45 to 54 and 55 to 65 . The two exceptions to this are females in ambulatory health care services and males in hospitals that have only their largest 2021 earnings in the one of these two age groups, that of ages 45 to 54 .

Second, in the four industry groups examined the most common age group for the three gender groups to have one of their two largest 2012 to 202110 year earning change is ages 45 to 54 , with the two exceptions of males and females in ambulatory health care services.

Third of the eight age groups in both gender, males, and females the age group with the largest or second largest earnings rate of change most often is in ages 65 to 99 . The exceptions are males in all industries, and hospitals.

Fourth, the ratio of male to female industry earnings in year 2021 is 1.5 to 1 in all industries, 2.7 in ambulatory health care services, 1.5 in hospitals and 1.1 to 1 in nursing and residential care facilities.

## This analysis and the findings allow three conclusions.

First, urban Oklahoma female health industry group employment outnumbering male employment will likely continue for some time into the future, as indicated by their current larger than male ratio in all three health industry groups, even with the male employment change rate higher than female in the three health industry groups.

Second, females' traditionally lower than males' earnings have the probability of reaching earnings parity at varying rates in each of the three-health industry groups; as indicated by the huge in difference in male to female earnings in ambulatory health care services, and hospitals, and the near parity in male to female earnings in nursing and residential care facilities; as modified by the rapid changing rate for females in ambulatory health care services, the relative low earnings change rates for females in hospitals and the lower earrings change rates for females compared to that of males in nursing and residential care facilities.

Third, urban Oklahoma health industry staffing, which has historically been problematic and presently still is the case, likely will increasingly be so in the future, as indicated by both gender's employment more rapid increase in the older two age groups and relatively lower employment 10-year increase in some of the three health groups four younger age groups.
