

OKSHINE Core Services

Community Health Record

The Oklahoma State Health Information Network and Exchange (OKSHINE) Clinical Portal is the platform used in Oklahoma's statewide health information exchange (HIE). This service provides appropriate access to the patient's consolidated health record at the point of care via the Clinical Portal or Single Sign On. The health record includes allergies, medications, labs, radiology, and other transcribed documents.

Subscribed Notifications

Improve care coordination with real-time Admission / Discharge / Transfer (ADT) notifications. Hospital admission follow-up, efficient care transitions to another facility, and care continuity and referral support are easier with ADT notifications. ADT notifications provide real-time alerts when a patient has an emergency department or inpatient encounter.

Communicate (Direct Secure Messaging)

Direct Secure Messaging (DSM) is a secure and encrypted tool, similar to email, to send health information directly to trusted recipients, while maintaining patient privacy and confidentiality.

Medicines Viewer

Medication history will be populated from contributing entities including pharmacies, providers, payers, and other connected OKSHINE participants. This information will include a current and discontinued list of prescriptions, in addition to dispense and refill history.

eMPI

Comprehensive patient matching using demographics, ensuring the right patient with each query and notification.

Provider and Relationship Registry

This registry is a central location for information about the individual and organizational providers in your enterprise.

Discover Analytics Engine

A robust analytics tool that gathers insight into the health of a population. It assists healthcare providers and organizations in planning and the delivery of care, in an effective, safe, and sustainable manner.

eCQM Module

OKSHINE will implement eCQM measurement and reporting (including behavioral health measures) to help providers meet mandatory reporting criteria in support of the Medicare and Medicaid Promoting Interoperability Programs, the Merit-based Incentive Payment System (MIPS), the Advanced Alternative Payment Models (Advanced APM), Medicaid Patient Centered Medical Home and other state health programs.
